

11 Consistency and Asymptotic Normality of OLSE

Regression model:

$$y = X\beta + u, \quad u \sim (0, \sigma^2 I_n)$$

Consistency:

1. Let $\hat{\beta}_n = (X'X)^{-1}X'y$ be the OLS with sample size n .

Consistency: As n is large, $\hat{\beta}_n$ converges to β .

210

where k is a positive constant.

Set $g(X) = X'X$, and X is replaced by $\frac{1}{n}X'u$.

Apply Chebyshev's inequality.

$$\begin{aligned} E\left(\frac{1}{n}X'u\right)' \frac{1}{n}X'u &= \frac{1}{n^2}E(u'XX'u) = \frac{1}{n^2}E(\text{tr}(u'XX'u)) = \frac{1}{n^2}E(\text{tr}(XX'u u')) \\ &= \frac{1}{n^2}\text{tr}(XX'E(uu')) = \frac{\sigma^2}{n^2}\text{tr}(XX') = \frac{\sigma^2}{n^2}\text{tr}(X'X) = \frac{\sigma^2}{n}\text{tr}\left(\frac{1}{n}X'X\right). \end{aligned}$$

Therefore,

$$P\left(\frac{1}{n}X'u\right)' \frac{1}{n}X'u \geq k \leq \frac{\sigma^2}{nk}\text{tr}\left(\frac{1}{n}X'X\right) \rightarrow 0 \times \text{tr}(M_{xx}) = 0$$

212

2. Assume the stationarity assumption for X , i.e.,

$$\frac{1}{n}X'X \rightarrow M_{xx}.$$

Then, we have the following result:

$$\frac{1}{n}X'u \rightarrow 0.$$

Proof:

According to Chebyshev's inequality, for $g(x) \geq 0$,

$$P(g(X) \geq k) \leq \frac{E(g(X))}{k},$$

211

Note that from the assumption,

$$\frac{1}{n}X'X \rightarrow M_{xx}.$$

Therefore, we have:

$$\left(\frac{1}{n}X'u\right)' \frac{1}{n}X'u \rightarrow 0,$$

which implies:

$$\frac{1}{n}X'u \rightarrow 0,$$

because $\left(\frac{1}{n}X'u\right)' \frac{1}{n}X'u$ indicates a quadratic form.

213

3. Note that

$$\frac{1}{n}X'X \rightarrow M_{xx}$$

results in

$$\left(\frac{1}{n}X'X\right)^{-1} \rightarrow M_{xx}^{-1}$$

\Rightarrow Slutsky's Theorem

(*) **Slutsky's Theorem** $g(\hat{\theta}) \rightarrow g(\theta)$, when $\hat{\theta} \rightarrow \theta$.

$$= \beta + \left(\frac{1}{n}X'X\right)^{-1} \left(\frac{1}{n}X'u\right).$$

Therefore,

$$\hat{\beta}_n \rightarrow \beta + M_{xx}^{-1} \times 0 = \beta$$

Thus, OLSE is a consistent estimator.

4. OLS is given by:

$$\hat{\beta}_n = \beta + (X'X)^{-1}X'u$$

214

215

Asymptotic Normality:

1. Asymptotic Normality of OLS

$$\sqrt{n}(\hat{\beta}_n - \beta) \rightarrow N(0, \sigma^2 M_{xx}^{-1}) \text{ when } n \rightarrow \infty.$$

2. **Central Limit Theorem:** Greenberg and Webster (1983)

Z_1, Z_2, \dots, Z_n are mutually independently distributed with mean μ and variance Σ_i .

216

4. Σ is defined as:

$$\Sigma = \lim_{n \rightarrow \infty} \left(\frac{1}{n} \sum_{i=1}^n \sigma^2 x_i' x_i \right) = \sigma^2 \lim_{n \rightarrow \infty} \left(\frac{1}{n} X' X \right) = \sigma^2 M_{xx},$$

where

$$X = \begin{pmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{pmatrix}$$

218

$$\begin{aligned} &= \left(\frac{1}{n} X' X \right)^{-1} \left(\frac{1}{n} X' E(uu') X \right) \left(\frac{1}{n} X' X \right)^{-1} \\ &= \sigma^2 \left(\frac{1}{n} X' X \right)^{-1} \rightarrow \sigma^2 M_{xx}^{-1}. \end{aligned}$$

Therefore,

$$\sqrt{n}(\hat{\beta} - \beta) \rightarrow N(0, \sigma^2 M_{xx}^{-1})$$

\Rightarrow Asymptotic normality (漸近の正規性) of OLS

The distribution of u_i is not assumed.

220

Then, we have the following result:

$$\frac{1}{\sqrt{n}} \sum_{i=1}^n (Z_i - \mu) \rightarrow N(0, \Sigma),$$

where

$$\Sigma = \lim_{n \rightarrow \infty} \left(\frac{1}{n} \sum_{i=1}^n \Sigma_i \right).$$

The distribution of Z_i is not assumed.

3. Define $Z_i = x_i u_i$. Then, $\Sigma_i = \text{Var}(Z_i) = \sigma^2 x_i' x_i$.

217

5. Applying Central Limit Theorem (Greenberg and Webster (1983), we obtain the following:

$$\frac{1}{\sqrt{n}} \sum_{i=1}^n x_i' u_i = \frac{1}{\sqrt{n}} X' u \rightarrow N(0, \sigma^2 M_{xx}).$$

On the other hand, from $\hat{\beta}_n = \beta + (X' X)^{-1} X' u$, we can rewrite as:

$$\sqrt{n}(\hat{\beta} - \beta) = \left(\frac{1}{n} X' X \right)^{-1} \frac{1}{\sqrt{n}} X' u.$$

$$\text{Var} \left(\left(\frac{1}{n} X' X \right)^{-1} \frac{1}{\sqrt{n}} X' u \right) = E \left(\left(\frac{1}{n} X' X \right)^{-1} \frac{1}{\sqrt{n}} X' u \left(\left(\frac{1}{n} X' X \right)^{-1} \frac{1}{\sqrt{n}} X' u \right)' \right)$$

219

12 Instrumental Variable (操作変数法)

12.1 Measurement Error (測定誤差)

Errors in Variables

1. True regression model:

$$y = \tilde{X}\beta + u$$

2. Observed variable:

$$X = \tilde{X} + V$$

221

V : is called the **measurement error** (測定誤差 or 観測誤差).

3. For the elements which do not include measurement errors in X , the corresponding elements in V are zeros.

4. Regression using observed variable:

$$y = X\beta + (u - V\beta)$$

OLS of β is:

$$\hat{\beta} = (X'X)^{-1}X'y = \beta + (X'X)^{-1}X'(u - V\beta)$$

222

That is,

$$\text{plim}\left(\frac{1}{n}V'u\right) = 0, \quad \text{plim}\left(\frac{1}{n}\tilde{X}'u\right) = 0.$$

6. OLSE of β is:

$$\hat{\beta} = \beta + (X'X)^{-1}X'(u - V\beta) = \beta + (X'X)^{-1}(\tilde{X} + V)'(u - V\beta).$$

Therefore, we obtain the following:

$$\text{plim}\hat{\beta} = \beta - (\Sigma + \Omega)^{-1}\Omega\beta$$

224

Therefore,

$$\begin{aligned} \text{plim}\begin{pmatrix} \hat{\alpha} \\ \hat{\beta} \end{pmatrix} &= \begin{pmatrix} \alpha \\ \beta \end{pmatrix} - \left(\begin{pmatrix} 1 & \mu \\ \mu & \mu^2 + \sigma^2 \end{pmatrix} + \begin{pmatrix} 0 & 0 \\ 0 & \sigma_v^2 \end{pmatrix} \right)^{-1} \begin{pmatrix} 0 & 0 \\ 0 & \sigma_v^2 \end{pmatrix} \begin{pmatrix} \alpha \\ \beta \end{pmatrix} \\ &= \begin{pmatrix} \alpha \\ \beta \end{pmatrix} - \frac{1}{\sigma^2 + \sigma_v^2} \begin{pmatrix} -\mu\sigma_v^2\beta \\ \sigma_v^2\beta \end{pmatrix} \end{aligned}$$

Now we focus on β .

$\hat{\beta}$ is not consistent. because of:

$$\text{plim}(\hat{\beta}) = \beta - \frac{\sigma_v^2\beta}{\sigma^2 + \sigma_v^2} = \frac{\beta}{1 + \sigma_v^2/\sigma^2} < \beta$$

226

5. Assumptions:

(a) The measurement error in X is uncorrelated with \tilde{X} in the limit. i.e.,

$$\text{plim}\left(\frac{1}{n}\tilde{X}'V\right) = 0.$$

Therefore, we obtain the following:

$$\text{plim}\left(\frac{1}{n}X'X\right) = \text{plim}\left(\frac{1}{n}\tilde{X}'\tilde{X}\right) + \text{plim}\left(\frac{1}{n}V'V\right) = \Sigma + \Omega$$

(b) u is not correlated with V .

u is not correlated with \tilde{X} .

223

7. Example: The Case of Two Variables:

The regression model is given by:

$$y_i = \alpha + \beta\tilde{x}_i + u_i, \quad x_i = \tilde{x}_i + v_i.$$

Under the above model,

$$\Sigma = \text{plim}\left(\frac{1}{n}\tilde{X}'\tilde{X}\right) = \text{plim}\left(\begin{pmatrix} 1 & \frac{1}{n}\sum\tilde{x}_i \\ \frac{1}{n}\sum\tilde{x}_i & \frac{1}{n}\sum\tilde{x}_i^2 \end{pmatrix}\right) = \begin{pmatrix} 1 & \mu \\ \mu & \mu^2 + \sigma^2 \end{pmatrix},$$

where μ and σ^2 represent the mean and variance of \tilde{x}_i .

$$\Omega = \text{plim}\left(\frac{1}{n}V'V\right) = \text{plim}\begin{pmatrix} 0 & 0 \\ 0 & \frac{1}{n}\sum v_i^2 \end{pmatrix} = \begin{pmatrix} 0 & 0 \\ 0 & \sigma_v^2 \end{pmatrix}.$$

225

12.2 Instrumental Variable (IV) Method (操作変数法 or IV 法)

Instrumental Variable (IV)

1. Consider the regression model: $y = X\beta + u$ and $u \sim N(0, \sigma^2 I_n)$.

In the case of $E(X'u) \neq 0$, OLSE of β is inconsistent.

2. **Proof:**

$$\hat{\beta} = \beta + \left(\frac{1}{n}X'X\right)^{-1}\frac{1}{n}X'u \rightarrow \beta + M_{xx}^{-1}M_{xu}.$$

227

where

$$\frac{1}{n}X'X \rightarrow M_{xx}, \quad \frac{1}{n}X'u \rightarrow M_{xu} \neq 0$$

3. Find the Z which satisfies $\frac{1}{n}Z'u \rightarrow M_{zu} = 0$.

Multiplying Z' on both sides of the regression model: $y = X\beta + u$,

$$Z'y = Z'X\beta + Z'u$$

Dividing n on both sides of the above equation, we take plim on both sides.

228

⇒ **Instrumental Variable Method (操作変数法 or IV 法)**

4. Assume the followings:

$$\frac{1}{n}Z'X \rightarrow M_{zx}, \quad \frac{1}{n}Z'Z \rightarrow M_{zz}, \quad \frac{1}{n}Z'u \rightarrow 0$$

5. **Distribution of β_{IV} :**

$$\beta_{IV} = (Z'X)^{-1}Z'y = (Z'X)^{-1}Z'(X\beta + u) = \beta + (Z'X)^{-1}Z'u,$$

which is rewritten as:

$$\sqrt{n}(\beta_{IV} - \beta) = \left(\frac{1}{n}Z'X\right)^{-1} \left(\frac{1}{\sqrt{n}}Z'u\right)$$

230

Then, we obtain the following:

$$\text{plim}\left(\frac{1}{n}Z'y\right) = \text{plim}\left(\frac{1}{n}Z'X\right)\beta + \text{plim}\left(\frac{1}{n}Z'u\right) = \text{plim}\left(\frac{1}{n}Z'X\right)\beta.$$

Accordingly, we obtain:

$$\beta = \left(\text{plim}\left(\frac{1}{n}Z'X\right)\right)^{-1} \text{plim}\left(\frac{1}{n}Z'y\right).$$

Therefore, we consider the following estimator:

$$\beta_{IV} = (Z'X)^{-1}Z'y,$$

which is taken as an estimator of β .

229

Applying the Central Limit Theorem to $\left(\frac{1}{\sqrt{n}}Z'u\right)$, we have the following result:

$$\frac{1}{\sqrt{n}}Z'u \rightarrow N(0, \sigma^2 M_{zz}).$$

Therefore,

$$\sqrt{n}(\beta_{IV} - \beta) = \left(\frac{1}{n}Z'X\right)^{-1} \left(\frac{1}{\sqrt{n}}Z'u\right) \rightarrow N(0, \sigma^2 M_{zx}^{-1} M_{zz} M_{zx}^{-1})$$

⇒ Consistency and Asymptotic Normality

231
