● Coefficient of Determination R^2:

Define e as $e = y - X\hat{\beta}$. The coefficient of determinant, R^2, is

$$R^2 = 1 - \frac{e'e}{y'My},$$

where $M = I_n - \frac{1}{n}ii'$, I_n is a $n \times n$ identity matrix and i is a $n \times 1$ vector consisting of 1, i.e., $i = (1, 1, \cdots, 1)'$.

$$Me = My - MX\hat{\beta}.$$

When $X = (\, i \quad X_2 \,)$ and $\hat{\beta} = \begin{pmatrix} \hat{\beta}_1 \\ \hat{\beta}_2 \end{pmatrix}$,

$$Me = e,$$

because $i'e = 0$, and

$$MX = M(\, i \quad X_2 \,) = (\, Mi \quad MX_2 \,) = (\, 0 \quad MX_2 \,),$$

because $Mi = 0$.

$$MX\hat{\beta} = \begin{pmatrix} 0 & MX_2 \end{pmatrix} \begin{pmatrix} \hat{\beta}_1 \\ \hat{\beta}_2 \end{pmatrix} = MX_2\hat{\beta}_2.$$

Thus,

$$My = MX\hat{\beta} + Me \qquad \Longrightarrow \qquad My = MX_2\hat{\beta}_2 + e.$$

$y'My$ is given by: $y'My = \hat{\beta}_2' X_2' MX_2\hat{\beta}_2 + e'e$, because $X_2'e = 0$ and $Me = e$.

The coefficient of determinant, R^2, is rewritten as:

$$R^2 = 1 - \frac{e'e}{y'My} \qquad \Longrightarrow \qquad e'e = (1 - R^2)y'My,$$

$$R^2 = \frac{y'My - e'e}{y'My} = \frac{\hat{\beta}_2' X_2' MX_2\hat{\beta}_2}{y'My} \qquad \Longrightarrow \qquad \hat{\beta}_2' X_2' MX_2\hat{\beta}_2 = R^2 y'My.$$

Therefore,

$$\frac{\hat{\beta}_2' X_2' MX_2\hat{\beta}_2/(k-1)}{e'e/(n-k)} = \frac{R^2 y'My/(k-1)}{(1-R^2)y'My/(n-k)} = \frac{R^2/(k-1)}{(1-R^2)/(n-k)} \sim F(k-1, n-k).$$

Thus, using R^2, the null hypothesis $H_0:\ \beta_2 = 0$ is easily tested.

5 Restricted OLS (制約付き最小二乗法)

1. Let $\tilde{\beta}$ be the restricted estimator.

   Consider the linear restriction: $R\beta = r$.

2. Minimize $(y - X\tilde{\beta})'(y - X\tilde{\beta})$ subject to $R\tilde{\beta} = r$.

   Let L be the Lagrangian for the minimization problem.

$$L = (y - X\tilde{\beta})'(y - X\tilde{\beta}) - 2\tilde{\lambda}'(R\tilde{\beta} - r)$$

   Because $\tilde{\beta}$ and $\tilde{\lambda}$ minimize the Lagrangian L,

$$\frac{\partial L}{\partial \tilde{\beta}} = -2X'(y - X\tilde{\beta}) - 2R'\tilde{\lambda} = 0$$
$$\frac{\partial L}{\partial \tilde{\lambda}} = -2(R\tilde{\beta} - r) = 0.$$

(*) Remember that $\dfrac{\partial a' x}{\partial x} = a$ and $\dfrac{\partial x' A x}{\partial x} = (A + A')x$.

From $\dfrac{\partial L}{\partial \tilde{\beta}} = 0$, we obtain:

$$\tilde{\beta} = (X'X)^{-1}X'y + (X'X)^{-1}R'\tilde{\lambda} = \hat{\beta} + (X'X)^{-1}R'\tilde{\lambda}.$$

Multiplying R from the left, we have:

$$R\tilde{\beta} = R\hat{\beta} + R(X'X)^{-1}R'\tilde{\lambda}.$$

Because $R\tilde{\beta} = r$ has to be satisfied, we have the following expression:

$$r = R\hat{\beta} + R(X'X)^{-1}R'\tilde{\lambda}.$$

Therefore, solving the above equation with respect to $\tilde{\lambda}$, we obtain:

$$\tilde{\lambda} = \left(R(X'X)^{-1}R'\right)^{-1}(r - R\hat{\beta})$$

Substituting $\tilde{\lambda}$ into $\tilde{\beta} = \hat{\beta} + (X'X)^{-1}R'\tilde{\lambda}$, the restricted OLSE is given by:

$$\tilde{\beta} = \hat{\beta} + (X'X)^{-1}R'\left(R(X'X)^{-1}R'\right)^{-1}(r - R\hat{\beta}).$$

(a) The expectation of $\tilde{\beta}$ is:

$$\begin{aligned}
\mathrm{E}(\tilde{\beta}) &= \mathrm{E}(\hat{\beta}) + (X'X)^{-1}R'(R(X'X)^{-1}R')^{-1}(r - R\mathrm{E}(\hat{\beta})) \\
&= \beta + (X'X)^{-1}R'(R(X'X)^{-1}R')^{-1}(r - R\beta) \\
&= \beta,
\end{aligned}$$

because of $R\beta = r$.

Thus, it is shown that $\tilde{\beta}$ is unbiased.

(b) The variance of $\tilde{\beta}$ is as follows.

First, rewrite as follows:

$$
\begin{aligned}
(\tilde{\beta}-\beta) &= (\hat{\beta}-\beta) + (X'X)^{-1}R'\Big(R(X'X)^{-1}R'\Big)^{-1}(R\beta - R\hat{\beta}) \\
&= (\hat{\beta}-\beta) - (X'X)^{-1}R'\Big(R(X'X)^{-1}R'\Big)^{-1}(R\hat{\beta} - R\beta) \\
&= (\hat{\beta}-\beta) - (X'X)^{-1}R'\Big(R(X'X)^{-1}R'\Big)^{-1}R(\hat{\beta}-\beta) \\
&= \Big(I_k - (X'X)^{-1}R'\Big(R(X'X)^{-1}R'\Big)^{-1}R\Big)(\hat{\beta}-\beta) \\
&= W(\hat{\beta}-\beta),
\end{aligned}
$$

where $W \equiv I_k - (X'X)^{-1}R'\Big(R(X'X)^{-1}R'\Big)^{-1}R$.

Then, we obtain the following variance:

$$
\begin{aligned}
\mathrm{V}(\tilde{\beta}) &\equiv \mathrm{E}((\tilde{\beta}-\beta)(\tilde{\beta}-\beta)') = \mathrm{E}(W(\hat{\beta}-\beta)(\hat{\beta}-\beta)'W') \\
&= W\mathrm{E}((\hat{\beta}-\beta)(\hat{\beta}-\beta)')W' = W\mathrm{V}(\hat{\beta})W' = \sigma^2 W(X'X)^{-1}W'
\end{aligned}
$$

$$
\begin{aligned}
&= \sigma^2\left(I - (X'X)^{-1}R'\left(R(X'X)^{-1}R'\right)^{-1}R\right)(X'X)^{-1} \\
&\qquad\qquad\qquad \times\left(I - (X'X)^{-1}R'\left(R(X'X)^{-1}R'\right)^{-1}R\right)' \\
&= \sigma^2(X'X)^{-1} - \sigma^2(X'X)^{-1}R'\left(R(X'X)^{-1}R'\right)^{-1}R(X'X)^{-1} \\
&= \mathrm{V}(\hat{\beta}) - \sigma^2(X'X)^{-1}R'\left(R(X'X)^{-1}R'\right)^{-1}R(X'X)^{-1}
\end{aligned}
$$

Thus, $\mathrm{V}(\hat{\beta}) - \mathrm{V}(\tilde{\beta})$ is positive definite.

3. Another solution:

Again, write the first-order condition for minimization:

$$\frac{\partial L}{\partial \tilde{\beta}} = -2X'(y - X\tilde{\beta}) - 2R'\tilde{\lambda} = 0,$$
$$\frac{\partial L}{\partial \tilde{\lambda}} = -2(R\tilde{\beta} - r) = 0,$$

which can be written as:

$$X'X\tilde{\beta} - R'\tilde{\lambda} = X'y,$$

$$R\tilde{\beta} = r.$$

Using the matrix form:

$$\begin{pmatrix} X'X & R' \\ R & 0 \end{pmatrix} \begin{pmatrix} \tilde{\beta} \\ -\tilde{\lambda} \end{pmatrix} = \begin{pmatrix} X'y \\ r \end{pmatrix}.$$

The solutions of $\tilde{\beta}$ and $-\tilde{\lambda}$ are given by:

$$\begin{pmatrix} \tilde{\beta} \\ -\tilde{\lambda} \end{pmatrix} = \begin{pmatrix} X'X & R' \\ R & 0 \end{pmatrix}^{-1} \begin{pmatrix} X'y \\ r \end{pmatrix}.$$

(*) Formula to the inverse matrix:

$$\begin{pmatrix} A & B \\ B' & D \end{pmatrix}^{-1} = \begin{pmatrix} E & F \\ F' & G \end{pmatrix},$$

where E, F and G are given by:

$$E = (A - BD^{-1}B')^{-1} = A^{-1} + A^{-1}B(D - B'A^{-1}B)^{-1}B'A^{-1}$$

$$F = -(A - BD^{-1}B')^{-1}BD^{-1} = -A^{-1}B(D - B'A^{-1}B)^{-1}$$

$$G = (D - B'A^{-1}B)^{-1} = D^{-1} + D^{-1}B'(A - BD^{-1}B')^{-1}BD^{-1}$$

In this case, E and F correspond to:

$$E = (X'X)^{-1} - (X'X)^{-1}R'\Big(R(X'X)^{-1}R'\Big)^{-1}R(X'X)^{-1}$$

$$F = (X'X)^{-1}R'\Big(R(X'X)^{-1}R'\Big)^{-1}.$$

Therefore, $\tilde{\beta}$ is derived as follows:

$$\begin{aligned}\tilde{\beta} &= EX'y + Fr \\ &= \hat{\beta} + (X'X)^{-1}R'\Big(R(X'X)^{-1}R'\Big)^{-1}(r - R\hat{\beta}).\end{aligned}$$

The variance is:

$$\mathrm{V}\begin{pmatrix} \tilde{\beta} \\ -\tilde{\lambda} \end{pmatrix} = \sigma^2 \begin{pmatrix} X'X & R' \\ R & 0 \end{pmatrix}^{-1}.$$

Therefore, $\mathrm{V}(\tilde{\beta})$ is:

$$\mathrm{V}(\tilde{\beta}) = \sigma^2 E = \sigma^2\Big((X'X)^{-1} - (X'X)^{-1}R'\Big(R(X'X)^{-1}R'\Big)^{-1}R(X'X)^{-1}\Big)$$

Under the restriction: $R\beta = r$,

$$\mathrm{V}(\hat{\beta}) - \mathrm{V}(\tilde{\beta}) = \sigma^2 (X'X)^{-1} R' \Big(R(X'X)^{-1} R' \Big)^{-1} R(X'X)^{-1}$$

is positive definite.

6 *F* Distribution (Restricted and Unrestricted OLSs)

1. As mentioned above, under the null hypothesis $H_0 : R\beta = r$,

$$\frac{(R\hat{\beta} - r)'(R(X'X)^{-1}R')^{-1}(R\hat{\beta} - r)/G}{(y - X\hat{\beta})'(y - X\hat{\beta})/(n-k)} \sim F(G, n-k),$$

where $G = \mathrm{Rank}(R)$.

Using $\tilde{\beta} = \hat{\beta} + (X'X)^{-1}R' \Big(R(X'X)^{-1}R' \Big)^{-1} (r - R\hat{\beta})$, the numerator is rewritten as follows:

$$(R\hat{\beta} - r)'(R(X'X)^{-1}R')^{-1}(R\hat{\beta} - r) = (\hat{\beta} - \tilde{\beta})'X'X(\hat{\beta} - \tilde{\beta}).$$

Moreover, the denominator is rewritten as follows:

$$
\begin{aligned}
(y - X\tilde{\beta})'(y - X\tilde{\beta}) &= (y - X\hat{\beta} - X(\tilde{\beta} - \hat{\beta}))'(y - X\hat{\beta} - X(\tilde{\beta} - \hat{\beta})) \\
&= (y - X\hat{\beta})'(y - X\hat{\beta}) + (\tilde{\beta} - \hat{\beta})'X'X(\tilde{\beta} - \hat{\beta}) \\
&\quad - (y - X\hat{\beta})'X(\tilde{\beta} - \hat{\beta}) - (\tilde{\beta} - \hat{\beta})'X'(y - X\hat{\beta}) \\
&= (y - X\hat{\beta})'(y - X\hat{\beta}) + (\tilde{\beta} - \hat{\beta})'X'X(\tilde{\beta} - \hat{\beta}).
\end{aligned}
$$

$X'(y - X\hat{\beta}) = X'e = 0$ is utilized.

Summarizing, we have following representation:

$$
\begin{aligned}
(R\hat{\beta} - r)'(R(X'X)^{-1}R')^{-1}(R\hat{\beta} - r) &= (\tilde{\beta} - \hat{\beta})'X'X(\tilde{\beta} - \hat{\beta}) \\
&= (y - X\tilde{\beta})'(y - X\tilde{\beta}) - (y - X\hat{\beta})'(y - X\hat{\beta}) \\
&= \tilde{u}'\tilde{u} - e'e,
\end{aligned}
$$

where e and $\tilde{u}$ are the restricted residual and the unrestricted residual, i.e., $e = y - X\hat{\beta}$ and $\tilde{u} = y - X\tilde{\beta}$.

Therefore, we obtain the following result:

$$
\frac{(R\hat{\beta} - r)'(R(X'X)^{-1}R')^{-1}(R\hat{\beta} - r)/G}{(y - X\hat{\beta})'(y - X\hat{\beta})/(n-k)} = \frac{(\tilde{u}'\tilde{u} - e'e)/G}{e'e/(n-k)} \sim F(G, n-k).
$$

7 Example: F Distribution (Restricted OLS and Unrestricted OLS)

1. `Equation 1`

Significance test:

`Equation 1` is:

$$\texttt{RCONS} = \beta_1 + \beta_2\texttt{RYD}$$

$H_0: \ \beta_2 = 0$

(No.1) t Test $\Longrightarrow$ Compare 88.2480 and $t(42-2)$.

(No.2) F Test $\Longrightarrow$ Compare $\dfrac{R^2/G}{(1-R^2)/(n-k)} = \dfrac{.994890/1}{(1-.994890)/(42-2)} =$ 7787.8 and $F(1,40)$. Note that $\sqrt{7787.8} = 88.2485$.

1% point of $F(1,40) = 7.31$

$H_0: \ \beta_2 = 0$ is rejected.

2. `Equation 2`:

$$\mathtt{RCONS} = \beta_1 + \beta_2 \mathtt{D1} + \beta_3 \mathtt{RYD} + \beta_4 \mathtt{RYD} \times \mathtt{D1}$$

$H_0: \beta_2 = \beta_3 = \beta_4 = 0$

F Test $\implies$ Compare $\dfrac{R^2/G}{(1-R^2)/(n-k)} = \dfrac{.999024/3}{(1-.999024)/(42-4)} = 12965.5$ and $F(3,38)$.

1% point of $F(3,38) = 4.34$

$H_0: \beta_2 = \beta_3 = \beta_4 = 0$ is rejected.

3. `Equation 1` vs. `Equation 2`

Test the structural change between 1973 and 1974.

$\texttt{Equation 2}$ is:

$$\texttt{RCONS} = \beta_1 + \beta_2\texttt{D1} + \beta_3\texttt{RYD} + \beta_4\texttt{RYD} \times \texttt{D1}$$

$H_0: \ \beta_2 = \beta_4 = 0$

Restricted OLS $\Longrightarrow$ $\texttt{Equation 1}$

Unrestricted OLS $\Longrightarrow$ $\texttt{Equation 2}$

$$\frac{(\tilde{u}'\tilde{u} - e'e)/G}{e'e/(n-k)} = \frac{(\texttt{.127951E} + \texttt{10} - \texttt{.244501E} + \texttt{09})/2}{\texttt{.244501E} + \texttt{09}/(42-4)} = 80.43$$

which should be compared with $F(2, 38)$.

1% point of $F(2, 38) = 5.211 < 80.43$

$H_0: \ \beta_2 = \beta_4 = 0$ is rejected.

$\Longrightarrow$ The structure was changed in 1974.
