• Convergence in Distribution (分布収束)  $X_n \longrightarrow X$ , i.e., X converges in distribution to X. The distribution of  $X_n$  converges to the distribution of X as n goes to infinity.

## **Some Formulas**

 $X_n$  and  $Y_n$ : Convergence in Probability

- $Z_n$ : Convergence in Distribution
- If  $X_n \longrightarrow a$ , then  $f(X_n) \longrightarrow f(a)$ .
- If  $X_n \longrightarrow a$  and  $Y_n \longrightarrow b$ , then  $f(X_n Y_n) \longrightarrow f(ab)$ .
- If  $X_n \longrightarrow a$  and  $Z_n \longrightarrow Z$ , then  $X_n Z_n \longrightarrow aZ$ , i.e., aZ is distributed with mean E(aZ) = aE(Z) and variance  $V(aZ) = a^2V(Z)$ .

8. Weak Law of Large Numbers (大数の弱法則) — Review:

*n* random variables  $X_1, X_2, \dots, X_n$  are assumed to be mutually independently and identically distributed, where  $E(X_i) = \mu$  and  $V(X_i) = \sigma^2 < \infty$ .

Then,  $\overline{X} \longrightarrow \mu$  as  $n \longrightarrow \infty$ , which is called the **weak law of large numbers**.

- $\rightarrow$  Convergence in probability
- $\rightarrow$  Proved by Chebyshev's inequality
- 9. Some Formulas of Expectaion and Variance in Multivariate Cases
   Review:

A vector of randam variable X:  $E(X) = \mu$  and  $V(X)((X - \mu)(X - \mu)') = \Sigma$ 

Then,  $E(AX) = A\mu$  and  $V(AX) = A\Sigma A'$ .

#### **Proof:**

$$\begin{split} & {\rm E}(AX) = A{\rm E}(X) = A\mu \\ & {\rm V}(AX) = {\rm E}((AX-A\mu)(AX-A\mu)') = {\rm E}(A(X-\mu)(A(X-\mu))') \\ & = {\rm E}(A(X-\mu)(X-\mu)'A') = A{\rm E}((X-\mu)(X-\mu)')A' = A{\rm V}(X)A' = A\Sigma A' \end{split}$$

### 10. Asymptotic Normality of MLE — Proof:

The density (or probability) function of  $X_i$  is given by  $f(x_i; \theta)$ . The likelihood function is:  $L(\theta; x) \equiv f(x; \theta) = \prod_{i=1}^n f(x_i; \theta)$ ,

where  $x = (x_1, x_2, \dots, x_n)$ .

MLE of  $\theta$  results in the following maximization problem:

 $\max_{\theta} \log L(\theta; x).$ 

22

A solution of the above problem is given by MLE of  $\theta$ , denoted by  $\tilde{\theta}$ .

That is,  $\tilde{\theta}$  is given by the  $\theta$  which satisfies the following equation:

$$\frac{\partial \log L(\theta; x)}{\partial \theta} = \sum_{i=1}^{n} \frac{\partial \log f(x_i; \theta)}{\partial \theta} = 0.$$

Replacing  $x_i$  by the underlying random variable  $X_i$ ,  $\frac{\partial \log f(X_i; \theta)}{\partial \theta}$  is taken as the *i*th random variable, i.e.,  $X_i$  in the **Central Limit Theorem II**.

### Consider applying Central Limit Theorem II.

In this case, we need the following expectation and variance:

$$E\left(\frac{1}{n}\sum_{i=1}^{n}\frac{\partial\log f(X_{i};\theta)}{\partial\theta}\right)$$
 and  $V\left(\frac{1}{n}\sum_{i=1}^{n}\frac{\partial\log f(X_{i};\theta)}{\partial\theta}\right)$ .

Defining the variance:

$$\mathsf{V}\Big(\frac{\partial \log f(X_i;\theta)}{\partial \theta}\Big) = \Sigma_i,$$

we can rewrite the information matrix as follows:

$$I(\theta) = V\left(\frac{\partial \log L(\theta; X)}{\partial \theta}\right) = V\left(\sum_{i=1}^{n} \frac{\partial \log f(X_i; \theta)}{\partial \theta}\right)$$
$$= \sum_{i=1}^{n} V\left(\frac{\partial \log f(X_i; \theta)}{\partial \theta}\right) = \sum_{i=1}^{n} \Sigma_i$$

The third equality holds when  $X_1, X_2, \dots, X_n$  are mutually independent.

Note that 
$$E\left(\frac{\partial \log L(\theta; X)}{\partial \theta}\right) = 0$$
 and  $V\left(\frac{\partial \log L(\theta; X)}{\partial \theta}\right) = I(\theta)$ .

$$\frac{1}{n}\frac{\partial \log L(\theta; X)}{\partial \theta} = \frac{1}{n}\sum_{i=1}^{n}\frac{\partial \log f(X_i; \theta)}{\partial \theta}$$

$$\sqrt{n}\left(\frac{1}{n}\sum_{i=1}^{n}\frac{\partial\log f(X_{i};\theta)}{\partial\theta}-\mathrm{E}\left(\frac{1}{n}\sum_{i=1}^{n}\frac{\partial\log f(X_{i};\theta)}{\partial\theta}\right)\right)\longrightarrow N(0,\Sigma),$$

where  

$$n \operatorname{V} \left( \frac{1}{n} \sum_{i=1}^{n} \frac{\partial \log f(X_i; \theta)}{\partial \theta} \right) = \frac{1}{n} \operatorname{V} \left( \sum_{i=1}^{n} \frac{\partial \log f(X_i; \theta)}{\partial \theta} \right) = \frac{1}{n} \operatorname{V} \left( \frac{\partial \log L(\theta; X)}{\partial \theta} \right)$$

$$= \frac{1}{n} I(\theta) \longrightarrow \Sigma.$$

That is,

.

$$\frac{1}{\sqrt{n}} \frac{\partial \log L(\theta; X)}{\partial \theta} \longrightarrow N(0, \Sigma),$$
  
where  $X = (X_1, X_2, \cdots, X_n).$ 

Now, consider replacing  $\theta$  by  $\tilde{\theta}$ , i.e.,

$$\frac{1}{\sqrt{n}}\frac{\partial \log L(\tilde{\theta};X)}{\partial \theta},$$

which is expanded around  $\tilde{\theta} = \theta$  as follows:

$$0 = \frac{1}{\sqrt{n}} \frac{\partial \log L(\tilde{\theta}; X)}{\partial \theta} \approx \frac{1}{\sqrt{n}} \frac{\partial \log L(\theta; X)}{\partial \theta} + \frac{1}{\sqrt{n}} \frac{\partial^2 \log L(\theta; X)}{\partial \theta \partial \theta'} (\tilde{\theta} - \theta).$$

Therefore,

$$\frac{1}{\sqrt{n}} \frac{\partial^2 \log L(\theta; X)}{\partial \theta \partial \theta'} (\tilde{\theta} - \theta) \approx -\frac{1}{\sqrt{n}} \frac{\partial \log L(\theta; X)}{\partial \theta} \longrightarrow N(0, \Sigma).$$

The left-hand side is rewritten as:

$$\frac{1}{\sqrt{n}}\frac{\partial^2 \log L(\theta; X)}{\partial \theta \partial \theta'} = \sqrt{n}\frac{1}{n}\frac{\partial^2 \log L(\theta; X)}{\partial \theta \partial \theta'}(\tilde{\theta} - \theta).$$

Then,

$$\begin{split} \sqrt{n}(\tilde{\theta} - \theta) &\approx - \Big(\frac{1}{n} \frac{\partial^2 \log L(\theta; X)}{\partial \theta \partial \theta'}\Big)^{-1} \Big(\frac{1}{\sqrt{n}} \frac{\partial \log L(\theta; X)}{\partial \theta}\Big) \\ &\longrightarrow N(0, \Sigma^{-1} \Sigma \Sigma^{-1}) = N(0, \Sigma^{-1}). \end{split}$$

Note that

$$\frac{1}{n} \frac{\partial^2 \log L(\theta; X)}{\partial \theta \partial \theta'} \longrightarrow \lim_{n \to \infty} \frac{1}{n} \mathbb{E} \left( \frac{\partial^2 \log L(\theta; X)}{\partial \theta \partial \theta'} \right) = \Sigma,$$
  
and  $\left( \frac{1}{n} \frac{\partial^2 \log L(\theta; X)}{\partial \theta \partial \theta'} \right)^{-1} \left( \frac{1}{\sqrt{n}} \frac{\partial \log L(\theta; X)}{\partial \theta} \right)$  has the same asymptotic distribution as  $\Sigma^{-1} \left( \frac{1}{\sqrt{n}} \frac{\partial \log L(\theta; X)}{\partial \theta} \right).$
