

Econometrics II

(Thu., 8:50-10:20)

Room # 4 (法経講義棟)

- The prerequisites of this class are **Special Lectures in Economics (Statistical Analysis)**, 経済学特論 (統計解析) (last semester) and **Econometrics I (エコノメトリックス I)** (graduate level, last semester).

TA Session

by Sakamoto (阪本 諒 r.sk2015.g [at] gmail.com;)

and Kiku (鞠 露瑤 juluyao [at] yahoo.com)

From

Oct. 13, 2021

PM16:50 – 18:20

1 Maximum Likelihood Estimation (MLE, 最尤法) — Review

1. We have random variables X_1, X_2, \dots, X_n , which are assumed to be mutually independently and identically distributed.
2. The distribution function of $\{X_i\}_{i=1}^n$ is $f(x; \theta)$, where $x = (x_1, x_2, \dots, x_n)$ and $\theta = (\mu, \Sigma)$.

Note that X is a vector of random variables and x is a vector of their realizations (i.e., observed data).

Likelihood function $L(\cdot)$ is defined as $L(\theta; x) = f(x; \theta)$.

Note that $f(x; \theta) = \prod_{i=1}^n f(x_i; \theta)$ when X_1, X_2, \dots, X_n are mutually independent.

dently and identically distributed.

The maximum likelihood estimator (MLE) of θ is θ such that:

$$\max_{\theta} L(\theta; X). \quad \iff \quad \max_{\theta} \log L(\theta; X).$$

MLE satisfies the following two conditions:

- (a) $\frac{\partial \log L(\theta; X)}{\partial \theta} = 0.$
- (b) $\frac{\partial^2 \log L(\theta; X)}{\partial \theta \partial \theta'}$ is a negative definite matrix.

3. **Fisher's information matrix** (フィッシャーの情報行列) is defined as:

$$I(\theta) = -E\left(\frac{\partial^2 \log L(\theta; X)}{\partial \theta \partial \theta'}\right),$$

where we have the following equality:

$$-E\left(\frac{\partial^2 \log L(\theta; X)}{\partial \theta \partial \theta'}\right) = E\left(\frac{\partial \log L(\theta; X)}{\partial \theta} \frac{\partial \log L(\theta; X)}{\partial \theta'}\right) = V\left(\frac{\partial \log L(\theta; X)}{\partial \theta}\right)$$

Proof of the above equality:

$$\int L(\theta; x)dx = 1$$

Take a derivative with respect to θ .

$$\int \frac{\partial L(\theta; x)}{\partial \theta} dx = 0$$

(We assume that (i) the domain of x does not depend on θ and (ii) the derivative $\frac{\partial L(\theta; x)}{\partial \theta}$ exists.)

Rewriting the above equation, we obtain:

$$\int \frac{\partial \log L(\theta; x)}{\partial \theta} L(\theta; x) dx = 0,$$

i.e.,

$$E\left(\frac{\partial \log L(\theta; X)}{\partial \theta}\right) = 0.$$

Again, differentiating the above with respect to θ , we obtain:

$$\begin{aligned}
 & \int \frac{\partial^2 \log L(\theta; x)}{\partial \theta \partial \theta'} L(\theta; x) dx + \int \frac{\partial \log L(\theta; x)}{\partial \theta} \frac{\partial L(\theta; x)}{\partial \theta'} dx \\
 &= \int \frac{\partial^2 \log L(\theta; x)}{\partial \theta \partial \theta'} L(\theta; x) dx + \int \frac{\partial \log L(\theta; x)}{\partial \theta} \frac{\partial \log L(\theta; x)}{\partial \theta'} L(\theta; x) dx \\
 &= E\left(\frac{\partial^2 \log L(\theta; X)}{\partial \theta \partial \theta'}\right) + E\left(\frac{\partial \log L(\theta; X)}{\partial \theta} \frac{\partial \log L(\theta; X)}{\partial \theta'}\right) = 0.
 \end{aligned}$$

Therefore, we can derive the following equality:

$$-E\left(\frac{\partial^2 \log L(\theta; X)}{\partial \theta \partial \theta'}\right) = E\left(\frac{\partial \log L(\theta; X)}{\partial \theta} \frac{\partial \log L(\theta; X)}{\partial \theta'}\right) = V\left(\frac{\partial \log L(\theta; X)}{\partial \theta}\right),$$

where the second equality utilizes $E\left(\frac{\partial \log L(\theta; X)}{\partial \theta}\right) = 0$.

4. **Cramer-Rao Lower Bound** (クラメル・ラオの下限): $(I(\theta))^{-1}$

Suppose that an unbiased estimator of θ is given by $s(X)$.

Then, we have the following:

$$V(s(X)) \geq (I(\theta))^{-1}$$

Proof:

The expectation of $s(X)$ is:

$$E(s(X)) = \int s(x)L(\theta; x)dx.$$

Differentiating the above with respect to θ ,

$$\begin{aligned} \frac{\partial E(s(X))}{\partial \theta} &= \int s(x) \frac{\partial L(\theta; x)}{\partial \theta} dx = \int s(x) \frac{\partial \log L(\theta; x)}{\partial \theta} L(\theta; x) dx \\ &= \text{Cov} \left(s(X), \frac{\partial \log L(\theta; X)}{\partial \theta} \right) \end{aligned}$$

For simplicity, let $s(X)$ and θ be scalars.

Then,

$$\begin{aligned} \left(\frac{\partial \mathbb{E}(s(X))}{\partial \theta} \right)^2 &= \left(\text{Cov} \left(s(X), \frac{\partial \log L(\theta; X)}{\partial \theta} \right) \right)^2 = \rho^2 \mathbb{V}(s(X)) \mathbb{V} \left(\frac{\partial \log L(\theta; X)}{\partial \theta} \right) \\ &\leq \mathbb{V}(s(X)) \mathbb{V} \left(\frac{\partial \log L(\theta; X)}{\partial \theta} \right), \end{aligned}$$

where ρ denotes the correlation coefficient between $s(X)$ and $\frac{\partial \log L(\theta; X)}{\partial \theta}$, i.e.,

$$\rho = \frac{\text{Cov} \left(s(X), \frac{\partial \log L(\theta; X)}{\partial \theta} \right)}{\sqrt{\mathbb{V}(s(X))} \sqrt{\mathbb{V} \left(\frac{\partial \log L(\theta; X)}{\partial \theta} \right)}}.$$

Note that $|\rho| \leq 1$.

Therefore, we have the following inequality:

$$\left(\frac{\partial \mathbb{E}(s(X))}{\partial \theta}\right)^2 \leq \mathbb{V}(s(X)) \mathbb{V}\left(\frac{\partial \log L(\theta; X)}{\partial \theta}\right),$$

i.e.,

$$\mathbb{V}(s(X)) \geq \frac{\left(\frac{\partial \mathbb{E}(s(X))}{\partial \theta}\right)^2}{\mathbb{V}\left(\frac{\partial \log L(\theta; X)}{\partial \theta}\right)}$$

Especially, when $\mathbb{E}(s(X)) = \theta$,

$$\mathbb{V}(s(X)) \geq \frac{1}{-\mathbb{E}\left(\frac{\partial^2 \log L(\theta; X)}{\partial \theta^2}\right)} = (I(\theta))^{-1}.$$

Even in the case where $s(X)$ is a vector, the following inequality holds.

$$\mathbb{V}(s(X)) \geq (I(\theta))^{-1},$$

where $I(\theta)$ is defined as:

$$\begin{aligned} I(\theta) &= -\mathbb{E}\left(\frac{\partial^2 \log L(\theta; X)}{\partial \theta \partial \theta'}\right) \\ &= \mathbb{E}\left(\frac{\partial \log L(\theta; X)}{\partial \theta} \frac{\partial \log L(\theta; X)}{\partial \theta'}\right) = \mathbf{V}\left(\frac{\partial \log L(\theta; X)}{\partial \theta}\right). \end{aligned}$$

The variance of any unbiased estimator of θ is larger than or equal to $(I(\theta))^{-1}$.

5. Asymptotic Normality of MLE:

Let $\tilde{\theta}$ be MLE of θ .

As n goes to infinity, we have the following result:

$$\sqrt{n}(\tilde{\theta} - \theta) \longrightarrow N\left(0, \lim_{n \rightarrow \infty} \left(\frac{I(\theta)}{n}\right)^{-1}\right),$$

where it is assumed that $\lim_{n \rightarrow \infty} \left(\frac{I(\theta)}{n}\right)$ converges.

That is, when n is large, $\tilde{\theta}$ is approximately distributed as follows:

$$\tilde{\theta} \sim N\left(\theta, (I(\theta))^{-1}\right).$$

Suppose that $s(X) = \tilde{\theta}$.

When n is large, $V(s(X))$ is approximately equal to $(I(\theta))^{-1}$.

Practically, we utilize the following approximated distribution:

$$\tilde{\theta} \sim N\left(\theta, (I(\tilde{\theta}))^{-1}\right).$$

Then, we can obtain the significance test and the confidence interval for θ

6. **Central Limit Theorem:** Let X_1, X_2, \dots, X_n be mutually independently distributed random variables with mean $E(X_i) = \mu$ and variance $V(X_i) = \sigma^2 < \infty$ for $i = 1, 2, \dots, n$.

Define $\bar{X} = (1/n) \sum_{i=1}^n X_i$.

Then, the central limit theorem is given by:

$$\frac{\bar{X} - E(\bar{X})}{\sqrt{V(\bar{X})}} = \frac{\bar{X} - \mu}{\sigma / \sqrt{n}} \rightarrow N(0, 1).$$

Note that $E(\bar{X}) = \mu$ and $V(\bar{X}) = \sigma^2/n$.
